Project Title: Vale grant for the Installation of a Geothermal System

Airport Code: PWM

Airport Name: Portland International Jetport

Key Contacts:

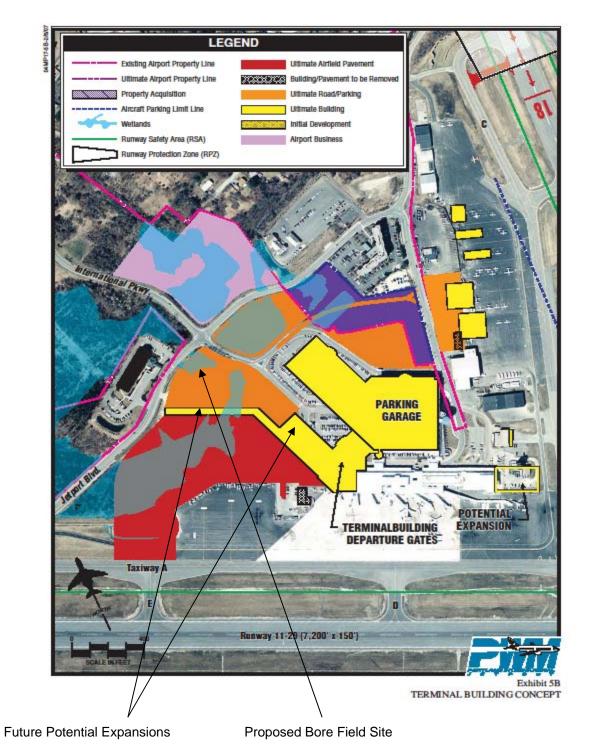

- Paul H Bradbury PE Portland International Jetport Airport Director
 1001 Westbrook Street Portland Maine.
 04102 Telephone: 207 756 8029 Mobile: 207 232 8106 phb@portlandmaine.gov
- 2. Roy S. Williams PE LEED AP Portland International jetport Deputy Director of Engineering and Facilities 1001 Westbrook Street Portland Maine. 04102 Telephone: 207 756 8026 Mobile: 207 317 1648 rsw@portlandmaine.gov

Section 2: Description of Proposed Emission Reduction Measures

The Portland International Jetport is owned and operated by the City of Portland and managed by the City's Department of Aviation and Transportation. The Portland International Jetport is currently engaged in a major construction terminal expansion that is scheduled to begin in April 2010. The Airport Director, Mr. Paul Bradbury and Mr. Roy Williams, the Airport Deputy Director of Engineering and Facilities, will be representing the City during the construction of the expansion and, if grant money is awarded, the installation and operation of the geothermal system. The Construction Manager is Turner Construction of Boston Mass and the Architect is Gensler whose office is also located in Boston Mass. The engineering designers are AMEC of Portland and the geothermal designers are Hayley and Aldridge of Boston.

The Jetport's principal air carriers are Air Tran, Continental, Delta, JetBlue, Air Wisconsin (aka United) and US Airways. Over the past year the airport has experienced larger than expected growth with a record passenger flows. The Portland International Jetport anticipates total passenger volume to continue to grow further and this growth, originating from the introduction of two new low cost airlines, has resulted in the need to expand the Portland Jetport's main terminal building. The existing passenger terminal building will be expanded in a north westerly direction (see Appendix D site plan). The terminal expansion is approximately 145,000 square feet and will include renovation of portions of the existing Jetport main terminal building. Scope of work shall include a relocated employee parking area and this shall be the site of the new geothermal system bore field. Much consideration was given to the location of the geothermal bore field as the projected life of the system is 40 years and the airports 30 year master plan shows growth in a westerly direction. Referring to Fig 1, it is clear that the optimal employee parking site has no conflict within the 30 year master plan.

It is confirmed that PWM is located in an area designated by the MeDEPAQ as a maintenance area for regulated pollutants and PWM is seeking AIP discretionary funding for the installation of a geothermal well system to reduce emitted pollutants from the planned terminal expansion base plan heating plant. In particular, if emission of Nox (Oxides of Nitrogen) and VOCs (Volatile Organic Compounds) can be reduced or avoided by reduction or elimination of No 2 fuel oil usage for heating purposes, it is obvious that the regional air quality will benefit. PWM is proposing to reduce emissions by producing heating from a geothermal plant with centralized heat pumps, supplemented by dual fuel (natural gas/ No 2 fuel oil) hot water boilers. The new geothermal plant will produce both heating and cooling, but since the focus is on heating plant emissions, the plant heat pump capacity will be optimized for heating and the cooling plant will be supplemented with a centrifugal chiller. The geothermal plant shall serve only the terminal addition.

The geothermal plant arrangement is as follows: A modular water to water heat pump system located in the new terminal addition mechanical room shall generate heating water at 130 deg. F and chilled water at 42 deg F, depending on the season. The bore field capacity shall allow the heat pump system to produce up to 180 tons (1.6 million Btus) of cooling and 2265 Mbtus/hr of heating or a combination of both that does not exceed an energy rate of 2265Mbtus/hr to the bore field. The heat pump system heating and cooling source will be a bore field of multiple 400 or 500 foot deep drilled wells located to the north west of the terminal addition underneath a proposed employee parking lot (see Appendix D site plan). Supply and return lines will run from a closed 2" or 3" dia. closed loop in each well to a supply manifold in an underground vault near the bore field and then run approximately 750 feet as a pair of 8" supply and return lines underground to the terminal expansion mechanical room. See Fig. 2.

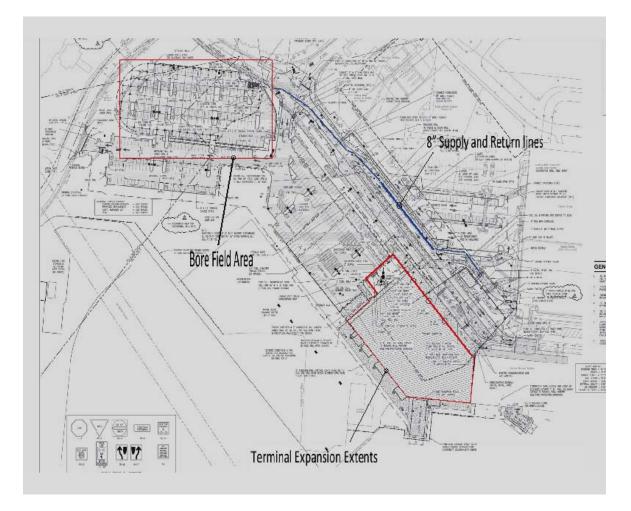

Fig 2.

A system pump and backup pump will circulate the heat source/heat sink loop fluid (15% propylene glycol/85% water) from the pumps in the terminal addition mechanical room to the bore field and back. From the heat pumps, 8" pipe manifolds will connect to the chilled water piping mains and the low temperature heating water mains. A system of low

temperature (130 deg F supply/110 deg F return) 8" heating water mains will be routed to hot water coils in Air Handling Units (AHU) 1 and 2 in the terminal addition mechanical well on the roof. A system pump and backup pump with variable frequency drives (VFDs) will circulate hot water through the low temperature piping mains to the low temperature heating equipment. A cross connection to the high temperature heating water mains will allow the hot water boilers to supplement the heat pumps during normal heating season operation and provide heating water for freeze protection if an extended electrical outage occurs. A system of high temperature (180 deg F supply/160 deg F return) 3" heating water mains will be routed to finned radiation along building perimeter walls, the door heater and unit heaters in stairwells and baggage handling spaces. The hot water boilers will provide hot water and each boiler will be sized to provide freeze protection for the terminal addition. A circulator pump will be provided for each boiler and a system pump, with VFDs, will circulate hot water through high temperature piping mains to the high temperature heating equipment.

Graphic representation of a geothermal system

The chilled water mains will serve AHUs 1 and 2 in the mechanical well on the roof, plus fan coil units and blower coils on lower levels. A 475 ton centrifugal chiller will also be piped to the chilled water mains for supplemental cooling. A system pump and a backup pump will circulate chilled water to the heat pump, chiller and cooling equipment. A fluid cooler mounted in the terminal addition mechanical well on the roof will provide heat rejection for the chiller capacity and a condenser pump with a VFD dedicate to the chiller will circulate water to the fluid cooler.

It is important to note that the chilled water system emission reductions are zero at the PWM site as there will be no oil energy consumption conducted during this process. However, there are substantial emissions reductions back at the electricity power generating plant but are not valid for this grant application and therefore have not been included. I have highlighted this chilled water narrative within this application to show that there are additional environmental benefits, albeit not within the Jetport area, from emission reductions and an electricity usage perspective but has no bearing on this application.

Overview of the Total Cost of Project

A summary of hard and soft costs are shown in Table 1 below. A more detailed

breakdown of these costs is reflected in the project application sheets in Appendix A. This summary reflects the selected bidder's costs for construction. Appendix D includes a spreadsheet that clearly shows the bid format with the lowest bidder breakdown. It is important to note that as this geothermal system supplements the Terminal Expansion, an early decision was made to "firewall" the mechanical room as the demarcation line where geothermal system starts and ends and no costs associated outside that firewall are included in this grant application other than the supply and return lines and bore field.

Description	Project Total Cost	89% Eligible	11% Ineligible	AIP @95% Funding	State and Local Share
Installation	\$ 2,791,191	\$2,484,160	\$307,031	\$2,359,952	\$431,239
Design Costs	\$ 204,396	\$181,912	\$ 22,484	\$172,817	\$31,579
Administration Expense	\$ 2,000	\$1,780	\$220	\$1,691	\$309
Total	\$2,997,587	\$2,667,852	\$ 329,735	\$2,534,460	\$ 463,127

Overview of Project Costs

Table 1 Local matching funds are provided from PWM cash reserves.

This application is requesting \$2,534,460 for the geothermal project. As the VALE EDMS reports indicate, this project is estimated to save a total emissions reduction of 41 tons of NOx and 43 tons of Ozone over the 40 year life span of the geothermal system (See Section 3). This would equal to over 101,912 gallons of oil saved per year and a projected savings of over 4 million gallons of heating oil over the life of the system (See Savings and Pollutant reductions Sheet in Appendix B).

To summarize, this geothermal project application is proposed as an effort to reduce emissions by using substantially less fuel oil consumption during the heating season using a ground source geothermal energy system taking advantage of the earth's stable temperature underground, providing heat energy in the winter and a bonus of a heat sink in the summer.

Section 3: Emission Reduction Estimates

The EDMS Approach

This following documents the rationale in deducing the on-site emissions reductions from the Jetport boiler plants by reducing the boiler plant fuel oil consumption using the VALE EDMS reporting software. A description of the existing and new terminal area heating plants follows:

Existing Terminal Boiler Plants

The existing 157,300 square foot Terminal space is served from two Boiler Plants in the East and West Wing Mechanical Penthouses. Each mechanical penthouse has two hot water boilers and each boiler is a maximum of 3 million Btuh input. The boilers in the East Penthouse Mechanical Room have dual-fuel capability and have both gas and oil supplies. The West Penthouse Mechanical Room boilers have only a fuel oil supply. The boilers generate hot water for air handling unit heating coils, unit heaters, finned radiation along the walls, radiant floor tubing and snow melt tubing buried in slabs outdoors.

New Expansion Boiler Plant

The proposed terminal expansion encloses an area of approximately 140,000 sf. Almost all of this space is provided with comfort heating to comply with ASHRAE Standard 55 Thermal Environmental Conditions for Human Occupancy. The proposed heating system is a hydronic system with hot water generated by oil-fired boilers circulated to Air Handling Unit heating coils, Variable Air Volume (VAV) box heating coils, unit heaters, radiant floors, snow melting systems and finned radiation along perimeter walls. The Boilers will generate hot water at temperatures up to 180 degrees °F. The hottest water will be circulated to the Air Handler Units heating coils, VAV box heating coils for ventilation air and building heating; and to unit heaters and finned radiation for building heating. Lower temperature (below 120 degrees °F) water will be circulated to tubing embedded in the floor slabs for building heating and to snow melt tubing buried outside.

Method of Estimating Emitted Pollutants and Pollutant Reduction

It is PWM's understanding that the basis of the VALE grant is to reduce the amount of oxides of nitrogen (Nox) emissions by use of a geothermal heat pump system to eliminate the firing of distillate (No. 2 fuel) oil. To make this determination, the following steps are needed:

- 1. Configure the Terminal addition heating systems as oil-fired boilers (Base configuration) and a Geothermal alternate with supplemental gas-fired boilers. (GSHP configuration).
- 2. Model the new terminal building, including location, floor areas, wall areas, glass areas, and roof areas. Input the thermal performance characteristics of the building components.
- 3. Generate and input building use schedules including lighting, people and ventilation.
- 4. Calculate the heating and cooling loads.
- 5. Generate the projected energy use for the addition in terms of heating fuel energy used annually.

- 6. Determine the Jetport as a major or minor emissions source and determine the required Best Available Control Technology (BACT).
- 7. Tabulate the heating fuel usage and convert to the energy units required by the emissions software. No. 2 fuel oil heat content is figured at 140,000 btu/gallon.
- 8. Model the heating plant emissions using EDMS (Emissions and Dispersion Modeling System) software from the Federal Aviation Administration Office of Environment and Energy. Compare the NOx emissions from the Base configuration and GSHP configuration to generate annual tons of NOX reduced by means of the GSHP system.
- Step 1: The heating systems were configured as follows: The Base configuration was a plant of two hot water boilers fired with 0.5% sulfur distillate fuel oil. The hot water would be generated at temperatures up to 180 deg °F and circulated to heating coils and finned radiation. The hot water would be mixed with cooler water for delivery to radiant floor and snow melt systems.

The GSHP configuration is a geothermal bore field of 500 foot +/- drilled wells circulating water to water-to-water heat pumps in the new Expansion Mechanical Room. The bore field will be used as a heat source for the heat pumps. Heating water will be generated by the heat pumps at temperatures up to 120 deg °F and circulated to radiant floors and snow melt systems. Heating coils for air handlers and fan coils are would be sized to provide adequate heat using lower temperature water from the heat pump system. A gas-fired condensing boiler plant would provide hot water for the unit heaters, the finned radiation along the exterior walls, and the domestic hot water system; heat pumps for domestic water heating will also be investigated. The hydronic heating system piping would be reconfigured with high-temperature and low temperature loops to the heating equipment.

- Step 2: The terminal addition was modeled with Trace 700 load modeling software from the Trane Company. A copy of selected output reports is included in Appendix B. In the interest of providing the most accurate output, the systems were modeled with and without domestic water heating load and the results have been tabulated below. The net result of the domestic water load was an increase of 3% in fuel use.
- Step 3: Schedules were generated for the lights, people and ventilation. These schedules are tabulated as percentages of the full occupancy and are shown in Appendix D. Two basic schedules; Ticketing and hold room, were generated and the occupied spaces were classified as one or the other. The projected total occupancy load was tabulated from the Architectural documents; a tabulation sheet with comments is included in the Appendix B.
- Step 4: The Jetport heating and cooling loads were generated. Copies of the Base Configuration loads are included in the Appendix B. The total heating load was 5900 Mbtuh and the total cooling load was 639 tons.

Step 5:	The heating energy use was modeled for the Base configuration and GSHP
	configuration and the results are tabulated below.

Jetport Expansion	Thousands of Btu/year	Gallons of No. 2 Fuel Oil/year	Kiloliters of No. 2 Fuel Oil/year
Oil Fired Boiler Plant No Domestic Hot Water	17,944,728	128,177	485.21
Oil Fired Boiler Plant Domestic Hot Water	18,413,576	131,525	497.88

Table 2 The Trace Energy Consumption Summary is included in the Appendix D

Step 6: Determination of Best Available Control Technology

The calculated boiler plant capacity has been projected at 6 million Btuh to meet the design heating load. As noted above, the existing boiler plants have an installed capacity of 12 million Btuh; hence the Jetport total heating plant capacity is 18 million Btuh which would seem to put the Jetport into the Minor Source category as defined by the State of Maine Department of Environmental Protection Chapter 115: Major and Minor Source Air Emission License Regulations. To corroborate this determination, a calculation for the Jetport plant emissions based on 2% sulfur No. 2 fuel oil and an annual projected fuel use per year was made. (No 2 fuel oil with a sulfur content of 2% or less is allowed by State of Maine Department of Environmental Protection Chapter 106 LOW SULFUR FUEL). According to the Jetport current air emission license, (See copy of page in Appendix B) the average annual boiler plant permitted fuel use is 98,000 gallons of No. 2 fuel oil per year. Assuming a domestic hot water load of 100Mbtuh during occupied periods, the building model projected a fuel use of 131,525 gallons of No. 2 fuel oil per year for the Terminal Expansion. The total fuel oil consumption for the existing and new boiler plants is estimated at 229,525 gallons per year.

According to the emissions factors contained in the US EPA Standard AP-42 COMPILATION OF AIR POLLUTANT EMISSION FACTORS Volume I: STATIONARY POINT AND AREA SOURCES, the following quantities of pollutants would be emitted during one year of plant operation, assuming 229,525 gallons of No. 2 fuel oil are burned: (See Table 1.3-1. in Appendix B)

C	RITERIA POLLUTANT	THRESHOLD FOR A MAJOR SOURCE
SO2:	32.59 tons per year	100 tons per year per Maine DEP standards
S03:	0.46 tons per year	100 tons per year per Maine DEP standards
NOx:	2.30 tons per year	100 tons per year per Maine DEP standards
CO:	0.57 tons per year	100 tons per year per Maine DEP standards
PM:	0.23 tons per year	100 tons per year per Maine DEP standards

Table 3

Hence, it is clear the boiler plants fall under the Minor Source definition of the State of Maine Department of Environmental Protection Chapter 115 regulations. This is a minor source with small boilers.

Since it is a minor source and the boilers are small and simple commercial types rather than large industrial or power boiler types with more sophisticated control systems, the Best Available Control Technology (BACT) for such plants has been considered to be the firing of low-sulfur (0.5% sulfur) fuel oil rather than more elaborate technology such as scrubbers. Recent Maine DEP license applications reviews have accepted low sulfur fuel with material specifications that comply with ASTM D396-78 *Standard Specifications for Fuel Oil*. Low sulfur No. 2 Fuel Oil is hereby presented as BACT for the new boiler plant.

Step 7: The heating energy baselines used for the emissions modeling is shown in table 4.

Jetport Expansion Only 131,525 Gallons of No. 2 Fuel Oil/year 497.88 Kiloliters of No. 2 Fuel Oil/year Oil Fired Boiler Plant – With Domestic Hot Water

Table 4

Step 8: Eliminating the concept to have the geothermal system supplement the existing terminal due to high upfront costs, the emission reductions for the new plant using a geothermal system was modeled using the EDMS software. The results are tabulated below:

Jetport Addition alone	Tons /year
Baseline Boiler plant	1.285
Geothermal and Boiler Plant	0.263
Reduction in tons of NOx	-1.02
Reduction in tons of VOC	-0.055

Total reduction in tons of Ozone -1.075	

Table 5 The Emission Reduction Reports are included in the Appendix A

Geothermal Program Optimization Field Study Comparison

A Geothermal Program Optimization Field Study Comparison analysis has been conducted to find the most cost effective geothermal program size, designed to maximize benefits, maximizing reductions of up front capital costs. This study was conducted as a secondary source of data to compare the EDMS software emission reductions, confirming viability of this proposed geothermal system.

The Terminal Expansion Project currently includes conventional heating and cooling systems which can be used to assist a geothermal system. This allowed a geothermal program field study to be developed which captured the base load, not the peak loads, which is far more cost effective than an "all geothermal" system. Various geothermal scenarios were developed, ranging from designs providing 10% of the annual heating to load up to 100% of the annual heating load. Firstly, geothermal designs for both the "terminal expansion only" and the "expansion and existing terminal" were evaluated. The scenarios that were investigated targeted the effect on the value proposition for capturing more/less heating loads, to reduce fuel oil consumption and limit the amount of VALE grant funding that would be potentially available. Each design also opportunistically uses the geothermal system to provide some of the building cooling loads to obtain additional energy reduction benefits and to maintain long term well field temperature balance. For each scenario, the number of wells and the size of the VALE grant funding was estimated, based on the estimated NOx and VOC reduction provided by the system. After reviewing the preliminary results, the design team quickly concluded that the geothermal designs for the "expansion and including the existing terminal building" scenario required too much up front capital costs and would not be feasible. Therefore, the recommendation moving forward was to design for the new terminal expansion only.

After investigating a range of geothermal system sizes, it was determined that a geothermal system that provided between 75% and 95% of the annual building heating load yielded the optimal combination of delivered long term benefit and least net cost, considering Vale grant funding. Larger geothermal systems (>95% of the annual heating load) were found to have increasing high up front capital costs, compared to the incremental benefit delivered. Similarly, the opportunity to maximize emission reductions became diminished for systems smaller than ones that provide <75% of the annual heating load. On this basis geothermal design of 95% annual heating load and 75% annual heating load were further developed as Scenarios A and B respectively. These will be described in more following detail. In order to "ground truth" the optimization analysis, the field study was conducted. This program consisted of drilling a single, 400ft deep pilot test well within the proposed limits of the well field and was conducted to

- Provide data for contractor pricing
- Allow a thermal load test to be conducted on site, to obtain site specific parameters for design
- Serve as a production geothermal well such that these "up front" costs would not be lost if the project moved forward.

The thermal load test provided the following results.

Thermal Load Test Results				
Measured Ambient Ground Temperatures – °F				
Estimated Thermal Conductivity 2.17				
Estimated Thermal Diffusivity (ft ² /day)				

Table 6 Details of well installation, the thermal load test and the log for GTW-101are not included inAppendix D but can be provided on request

Combining the results of the optimization work together with the validated ground characteristics from the field test program, the following scenarios are recommended.

- Scenario A: 95% of low temperature base load heating and opportunistic cooling for the new addition only. This geothermal system would require 60,000 linear feet of geothermal well
- Scenario B: 75% of low temperature base load heating and opportunistic cooling for the new addition only. This geothermal system would require 44,000 linear feet of geothermal well.

Given the available bore field space restrictions and other issues, it was recommended that each geothermal well be installed to depths of between 400 and 500feet below grade surface. Accordingly, the above scenarios would yield:

	Scenario	Scenario
Well depth	Α	В
400ft	150	110
500ft	120	88

Number of wells per Scenario

Table 7

The above program recommendations are based on the following:

- Multistack MS5oZ644 heat pumps
- 15% propylene glycol antifreeze
- Supply temperatures delivered from the field range from 40°F and 90°F
- Chilled water supply of 44°F
- Hot water supply temperature of 130°F
- 20ft center to center well spacing

- 1.25" diameter HDPE U tube
- 1.0 Btu/hr/ft-°F thermal conductivity grout
- Geo-clips spaced on 10ft centers
- Wells with a 6" drilled borehole diameter.

Both systems will require assistance from the conventional systems. Generally, the geothermal system is designed to provide base load heating and cooling to the planned addition. The following supplemental heating and cooling assistance will be required to cover the balance of the heating and cooling loads not covered by the geothermal system.

	Annual		Peak	
Scenario	Heating (MBtu)	Cooling (MBtu)	Heating (MBtu)	Cooling (MBtu)
А	786,350	9,390,865	1,849	5,885
В	3,679,508	10,909,939	2,538	6,374

Table 8 Supplemental heating and Cooling Required

System benefits include reduced NOx and VOCs reductions. See table 9 below

Table 9 - Field determined Predicted Annual Ozone Emissions Reductions by
Scenario

Scenario	NOx and VOC (ton/yr)
Α	0.83
В	0.66

It is clear that Scenario A captures the most benefit. As outlined in Table 7, either option of 150 wells at 400 ft depth or 120 wells of 500 ft depth or any number in between those depths that would yield the required 60,000 lineal feet of well bores maximizing thermal transfer.

Conclusions:

The total emission reductions estimated for the 40 year life cycle of the project, is summarized in table 10 below. If a comparison is studied between the EDMS annual reductions of 1.02 tons/year for NOx and 0.055 tons per year for VOCs this would yield a total of **1.075** tons per year of Ozone reductions. The field study ozone reductions using a different modeling system has ozone reductions of **0.83** (see table 9) tons per year. This is considered an acceptable range of disparity and concludes that the EDMS software predicted quantity of ozone reduction is reliable and will be used in this application.

	EDMS Total Emission Reductions

Table 10

Summary:

PWM is confident in stating that this proposed system can significantly reduce the carbon footprint of the new expansion by utilizing an on-site source of clean, renewable energy which falls in line with the VALE mission statement "VALE is a national program to reduce airport ground emissions at commercial service airports located in designated air quality nonattainment and maintenance areas. The program was established to finance low emission vehicles, refueling and recharging stations, gate electrification, and <u>other airport air quality improvements</u>".

Section 4: Confirmation that Emission Reductions meet CAA Criteria

4.1 Quantifiable:

The emission reductions have been determined by using the EDMS software version 5.1.2. In addition to the EDMS modeling software, a PWM funded field study was performed (as described in section 3) to compare predicted emission reductions. Both of these methods can be verified.

4.2 Surplus:

This application is proposing a geothermal system that is entirely voluntary and any emission reductions associated with this system are not required by any Federal, State or Local regulatory control measures or have been allocated to any other emission reduction project. Although the geothermal system is a supporting infrastructure to the terminal expansion, the system proposed is in addition to the terminal expansion project and has no direct bearing on the Terminal Expansion Project funding mechanisms and stands alone as a project in its own right.

4.3 Federally Enforceable:

The emission reductions will be enforceable through FAA's grant assurance provisions and through the VALE Program special conditions. The jetport will maintain documentation on fuel usage, using fuel meters and calculated emission reductions on a monthly basis. These data sheets will be forwarded to the State air quality department to assure predicted reductions are met. The jetport will plan on displaying a dynamic display in the terminal and on their website that clearly shows to the public the emission reductions and the mechanics of the geothermal system as a learning tool on sustainability.

4.4 Permanent:

The geothermal system is a statically located piece of infrastructure with limited moving parts and, therefore, it is stated that it is permanent. It is predicted that the system shall continue to reduce emissions on a continual basis through the system's life cycle. It is very much in the interest of PWM to monitor usage of oil consumption, which is directly related to the emission reductions, so a methodology, a stated in 4.3, will be in place to track this system over its useful life.

4.4 Adequately Supported:

PWM is a regional airport that has seen significant passenger growth over the last 5 years. In quantitative terms, the Jetport has grown from 680,000 enplanements in 2004 to over 900,000 enplanements in 2009. CY 2010 and 2011 forecast show increased growth to above 950,000 enplanements. The longer Forecast for activity shows rapid growth tapering off by 2015 and continuing moderate growth beyond. PWM showed adequate profits of \$3.4m in FY 2010 and it is predicted that PWM shall remain profitable in the foreseeable future. With a staff of over 45 people, that includes a large maintenance and engineering department, PWM is confident to state that they are adequately prepared to monitor and maintain the geothermal system once in operation.

Section 5: Relationship to State implementation plan

The Maine Department of Environment Protection Bureau of Air Quality has confirmed that there is no relationship with this applications predicted emission reductions and the State Implementation plan. If you require further confirmation on this matter, please contact Kathy Tarbuck at (207) 287 9931 or <u>kathy.tarbuck@maine.gov</u>

Section 6: Funding Sources

PWM is anticipating that 95% of the 89% allowable Project Total Cost for this geothermal project will come from AIP VALE funds. There will be no PFC funds allocated to this project. The required Local Share shall come from PWM cash reserve which is supported by other airport revenues.

Table 11 below summarizes the funding for the proposed project. As stated in Section 2, PWM is requesting the FAA to provide AIP VALE funds in the amount of \$ 2,534,460 representing an 95% VALE portion of the 89 % eligible of Project Total Cost. This percentage cost is consistent with the FAA guidelines indicated in the AIP Handbook Section 601 for public use areas.

Description	Project Total Cost	89% Eligible	11% Ineligible	AIP @ 95% Funding	State and Local Share
Installation	\$ 2,791,191	\$2,484,160	\$307,031	\$2,359,952	\$431,239
Design Costs	\$ 204,396	\$181,912	\$ 22,484	\$172,817	\$31,579
Administration Expense	\$ 2,000	\$1,780	\$220	\$1,691	\$309
Total	\$2,997,587	\$2,667,852	\$ 329,735	\$2,534,460	\$ 463,127

Overview of Project Costs

Table 11

Section 7: Cost Effectiveness

Based on the average estimate of emission reductions as stated in section 3, the projected emission reduction of ozone, over the life cycle of the system, is 43.026 tons. Therefore, the cost effectiveness of Ozone reduction (NOx + VOC) is 69,669 per ton. See table 12 below. The cost effectiveness values of all pollutants are shown on this sheet also. The jetport concludes that because of the large investment in supporting infrastructure, there is a low cost effectiveness. It is this reason that because of the high dollar "up front" costs determining the low value effectiveness compared with the ranges shown in the VALE Technical report. The Jetport requests that due to the Jetport's size and reflecting on that the geothermal application is a new concept for VALE funding, that this cost effectiveness be considered acceptable and funding is granted.

It should also be noted that there is additional ozone reductions due to the cooling season that have been omitted in this application which would improve the cost effectiveness (See section 2)

Pollutant	Projected Emission Reductions over Useful Life of Project Vehicles and Equipment (tons)	Cost Effectiveness over Useful Life of Project Vehicles and Equipment (\$/ton)
NOx	40.818	\$73,437.87
VOC	2.208	\$1,357,602.81
Ozone (NOx + VOC)	43.026	\$69,669.20
со	10.204	\$293,765.88
PM ₁₀	2.194	\$1,366,265.72
PM _{2.5}	1.686	\$1,777,928.23

Section 8: Vehicle Commitments

This section is not applicable as the grant request is for infrastructure only.

Section 9: Schedule

Please the Project Schedule in Appendix D for an overall projected timeline. As an overview, the terminal expansion project is as follows:

- *VALE Grant approved* -1^{st} *May* 2010
- Geothermal Contract Awarded Early May 2010
- 15th May 2010 commencement of boring of wells
- Wells/trenching completed Oct 2010
- Building closed in 1st February 2011
- Mechanical Systems in place commissioning June 2011
- Geothermal on line and commissioned Aug 1st 2011.
- Terminal occupied Oct 1st 2011

New Portland Jetport Terminal Space Model – Calculated Occupancy Load

Departing Passengers	10	50 (1	L)
Arriving Passengers	10	50 (2	2)
Holdroom Passengers	3	93 (3	3)
Staff i	1	.00 (4	4)

Total

In Line

10

2593 (5)

Notes:

(1) Based on Gensler Terminal Addition and Renovations Basis of Design Narrative, May 2008 pg. 3.

(2) Based on Gensler Terminal Addition and Renovations Basis of Design Narrative, May 2008 pg. 4.

(3) Based on Gensler Terminal Addition and Renovations Basis of Design Narrative, May 2008 pg. 6.

- (4) Based on TSA employees each for 5 screening rows; 6 TSA employees for private screening; 9 TSA employees for baggage screening; 6 police officers on duty, 12 baggage handlers, 6 airline ticketing agents, 6 airline staff support, 3 Jetport administrative personnel, 4 Jetport maintenance personnel, and 18 concessions personnel.
- (5) Based on a person count schedule on Gensler architectural drawing A00.10, but assuming as a worst case that departing and arriving passengers peak at the same time. The Gensler people total is 2557 persons, or 98.6% of the Oest total.

about 75% is NO. For utility vertical fired boilers use 105 lb/10³ gal at full load and normal (>15%) excess air. Nitrogen oxides emissions from residual oil combustion in industrial and commercial boilers are related to fuel nitrogen content, estimated by the following empirical relationship: 1b NO $_2/10^3$ gal = 20.54 + 104.39(N), where N is References 6-7,15,19,22,56-62. Expressed as NO₂. Test results indicate that at least 95% by weight of NO x is NO for all boiler types except residential furnaces, where References 1-2,6-8,16,57-60. S indicates that the weight % of sulfur in the oil should be multiplied by the value given. For example, if the fuel is 1% sulfur, then S = 1. References 6-8,14,17-19,56-61. CO emissions may increase by factors of 10 to 100 if the unit is improperly operated or not well maintained. the weight % of nitrogen in the oil. For example, if the fuel is 1% nitrogen, then N = 1. -1 e

References 6-8,10,13-15,56-60,62-63. Filterable PM is that particulate collected on or prior to the filter of an EPA Method 5 (or equivalent) sampling train. Particulate emission factors for residual oil combustion are, on average, a function of fuel oil sulfur content where S is the weight % of sulfur in oil. For example, if fuel oil is 1% Based on data from new burner designs. Pre-1970's burner designs may emit filterable PM as high as 3.0 1b/10³ gal.

GENERAL AIR EMISSION LICENSE INFORMATION

State of Maine Department of Environmental Protection Bureau of Air Quality

(Revised 4/97)

• What is the purpose of an air emission license?

The purpose of an air emission license is to compile all requirements, regulations and consents relating to air pollution for a facility in one document.

Maine has had an existing licensing program in place since the early 1970's for the licensing of major and minor sources of air pollution. In the Clean Air Act Amendments of 1990, licensing was mandated for major sources. Maine has been given the authority over this program in 38 M.R.S.A. Section 344 and 590.

Who must apply?

Both Minor and Major sources must apply for air emission licenses. Please refer to Maine Regulations Chapter 115 (licensing for minor sources) and Chapter 140 (licensing for major sources) for a detailed applicability determination. The summaries stated below are not a comprehensive outline of what regulations the facility may be subject to, but rather a general guideline.

- Under Chapter 115 - minor sources 🦼

In general, sources subject to Chapter 115 include facilities with the Potential to Emit <u>less</u> than the following:

50 ton per year of VOC.

10 ton per year of a single Hazardous Air Pollutant.

25 ton per year of all Hazardous Air Pollutants combined.

100 ton per year of any other regulated pollutant (PM PM_{10} , SO₂, NO_X, CO).

The following are exemptions to licensing - for a complete list of licensing exemptions, see Chapter 115, Section (1)(C):

University of Southern Maine Cumberland County Gorham, Maine A-462-71-L-A

A summary of the BACT analysis for Boilers #5, #6 and #7 is the following:

4

- 1. Chapter 106 regulates fuel sulfur content. However the use of natural gas or #2 fuel oil which meets the criteria in ASTM D396, is more stringent and shall be considered BACT.
- 2. Chapter 103 regulates PM emission limits. However, the PM limits of 0.05 lb/MMBtu when firing Natural Gas and 0.08 lb/MMBtu when firing #2 fuel oil are more stringent and shall be considered BACT.
- 3. SO₂ emission limits are based a mass balance when firing #2 fuel oil, and AP-42 data dated 07/98 when firing natural gas:
- 4. NO_x, CO and VOC emission limits are based on AP-42 data dated 09/98 and 7/98 for the combustion of fuel oil and natural gas respectively.
 - NO_X #2 Fuel Oil 20 lb NO_X/1000 gal Natural Gas – 100 lb/MMscf
 - CO #2 Fuel Oil 5 lb CO/1000 gal Natural Gas – 84 lb CO/MMscf
 - VOC #2 Fuel Oil 0.556 lb VOC/1000 gal Natural Gas – 5.5 lb VOC/MMscf
- 5. When firing #2 fuel oil, visible emissions from the combined stack serving boilers #5, #6 and #7 shall not exceed 20% opacity on a six (6) minute block average.
- 6. When firing Natural Gas, visible emissions from the combined stack serving boilers #5, #6 and #7 shall not exceed 10% opacity on a six (6) minute block average.

D. Emergency Generator #4

Emergency generator #4 has a maximum rated capacity of 0.55 MMBtu/hr.

Emergency generators are only to be operated for maintenance purposes and for situations arising from sudden and reasonably unforeseeable events beyond the control of the source. Back-up generators are not to be used for prime power when reliable offsite power is available.

A summary of the BACT analysis for Emergency Generator #4 is the following:

- 1. Emergency generator #4 shall be limited to 500 hr/yr of operation based on a 12 month rolling total. Compliance shall be demonstrated by a written log of all generator operating hours.
- 2. 06-096 CMR 106 regulates fuel sulfur content. However, the use of natural gas is more stringent and shall be considered BACT.
- 3. A PM emission limit of 0.05 lb/MMBtu shall be considered BACT. The PM_{10} limits are derived from the PM limits.

STATE OF MAINE DEPARTMENT OF ENVIRONMENTAL PROTECTION

JOHN ELIAS BALDACCI GOVERNOR

February 17, 2010

LaVerne Reid Federal Aviation Authority New England Headquarters 12 New England Executive Park Burlington, MA 01803

RE: Airport Emission Reduction Credits City of Portland, Maine - Portland International Jetport

Dear LaVerne Reid:

The Maine Department of Environment Protection, Bureau of Air Quality (Department) has reviewed the application for the Airport Emission Reduction Credits (AERCS) received from the Portland International Jetport (PWM) on February 17, 2010. The Department has determined that the proposed low-emission project described in the Portland International Jetport's application meets the requirements of the Clean Air Act and is consistent with Vision 100 (P.L.108-176) as implemented by the Federal Aviation Administration (FAA) Voluntary Airport Low Emission (VALE) "Technical report" and associated U.S. Environmental protection Agency (EPA) "Guidance on Airport Emission reduction Credits for Early measures through Voluntary Airport Low Emission Programs".

The preliminary review of the Portland International Jetport's Vale project application indicates that the emission reduction estimates are reasonable and accurate. Based on this review, the Department accepts the Portland International Jetport's application and will make a timely future determination of AERCs based solely on VALE and AERC program guidance in relation to general conformity and new source review (NSR) regulations. Approved AERCs for general conformity will be granted by the Department on a one to one basis (project emission reductions to AERCs by pollutant), while AERCs for NSR will be granted, if eligible on a similar basis or according to Department and NSR regulations and procedures.

The Department will grant AERCs to Portland International Jetport following FAA project funding and receipt of updated Portland International Jetport emission reduction estimates. The AERCs for this project may only be used at the Portland International Jetport. Portland International Jetport is responsible for project tracking and record keeping and for making this information available to the Department and public as requested.

16 April 2010 File No. 35024-110

Deluca Hoffman 778 Main Street South Portland, Maine 04106

Attention: Dwight Anderson

Subject: Bidder Qualification Review, AIP 3-23-0038-70 Portland International Jetport (PWM) Portland Maine

Ladies and Gentlemen:

We have completed our review of the bidders' proposals, received by our office on 15 April 2010. Our review was focused specifically on qualifications with respect to technical Specification Section 23 81 46.

We noted that the National Geothermal bid includes three drilling subcontractors, Plumbago Drilling, Adam Baker Well Drilling, and Maine Well and Pump. We have not been able to verify that these companies are licensed well drillers in the State of Maine. We have attempted to verify their status with the State in telephone communications on 15 April 2010. We understand that the City has also made inquiries to confirm their licensure status. These inquiries are on going.

Based on information included in the bids, we would consider the National Geothermal proposal non-qualifying and recommend that it be withdrawn from consideration. Specification Section 23 81 46, Article 1.06.A.1 states that the "Contractor that installs the wells be licensed in the State of Maine." This requirement was included in consideration of the best interest of the Owner. We consider a licensed driller as a minimum qualification for installation the wells. There are over 150 licensed well drillers in the State of Maine.

This project requirement was also included in anticipation that the State of Maine will soon adopt, potentially during the course of this project, regulations that will require, by law, licensed well drillers for geothermal projects. We believe that it is in the best interest of the Owner to avoid this potential non-compliance that could occur during well field construction. Hence, we made this potential future requirement part of the minimum qualifications for the project.

Sincerely yours, HALEY & ALDRICH, INC.

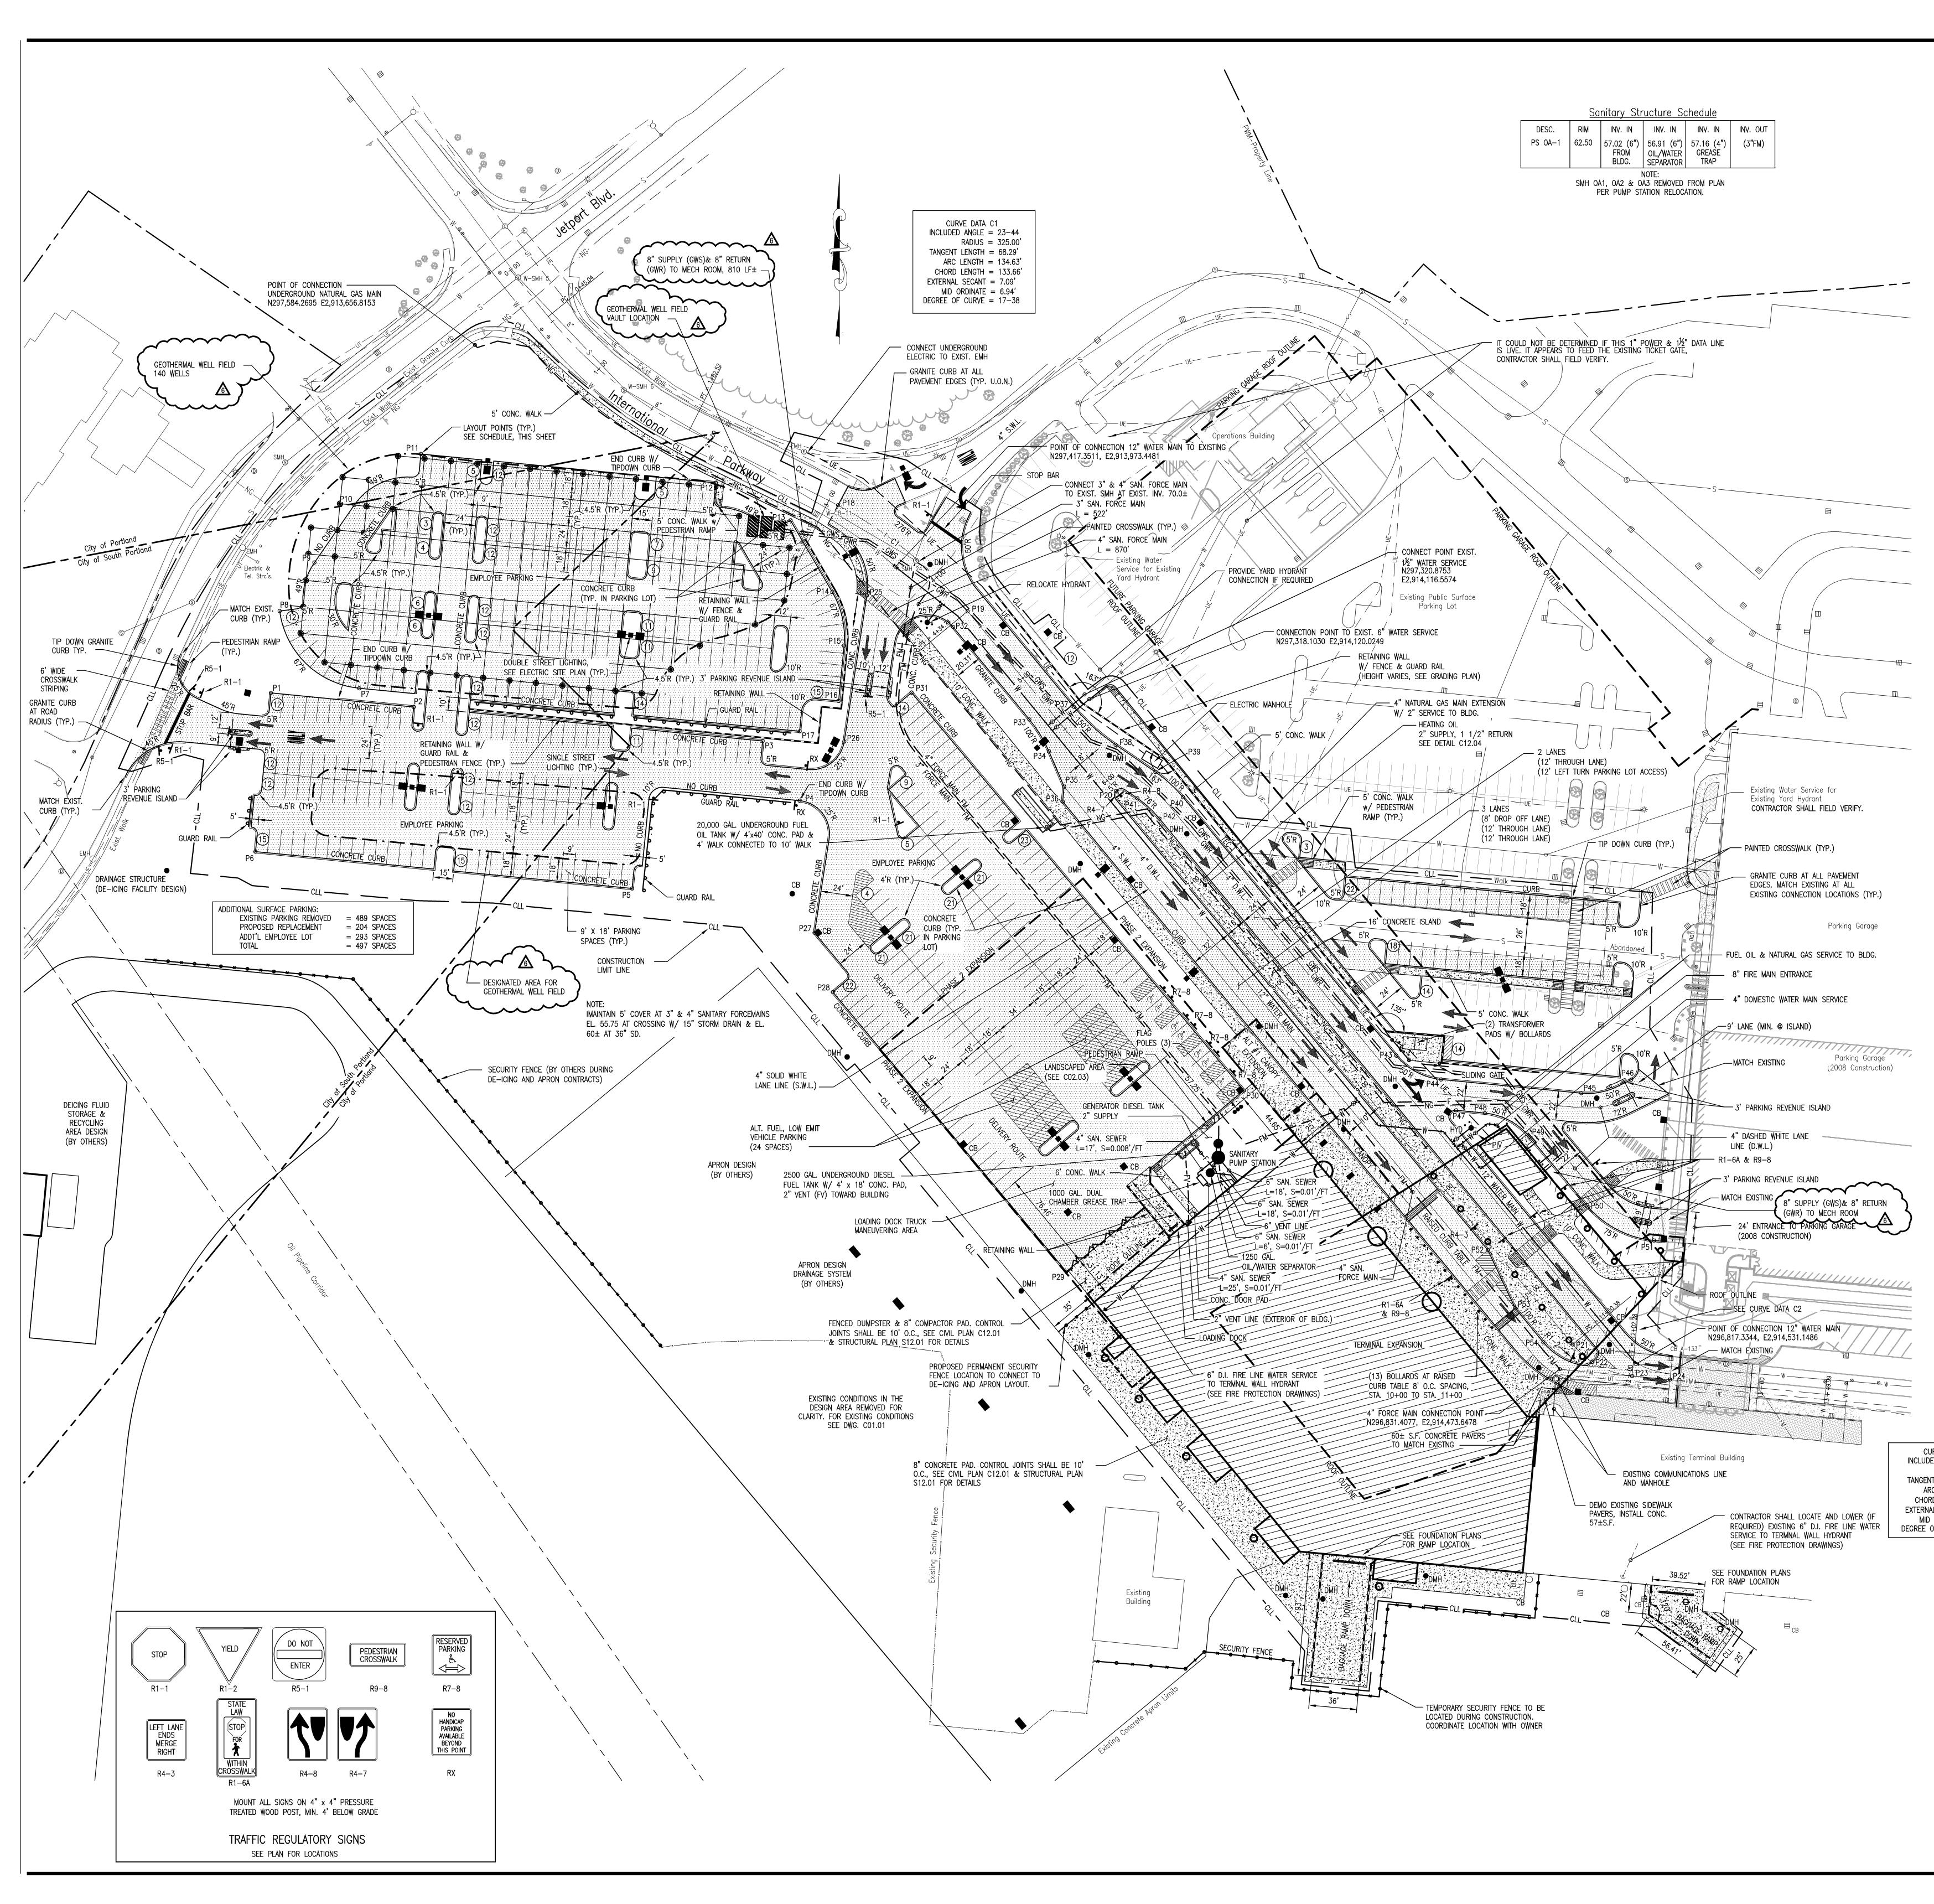

Paul F. Ormond Senior Engineer

GENERAL NOTES

- 1. ALL ENTRANCE ROADWAY, PUBLIC SURFACE PARKING AREAS AND PARKING GARAGE ACCESS CURBING SHALL BE TYPE I
- GRANITE VERTICAL CURB.2. CONCRETE CURBING SHALL BE USED IN THE EMPLOYEE
- PARKING LOTS.3. DIMENSIONS ARE TO FACE OF CURB UNLESS OTHERWISE
- INDICATED. 4. SEE ARCHITECTURAL PLANS FOR CONCRETE SIDEWALK JOINT
- PATTERN AND LAYOUT AT THE 25 FOOT WIDE ENTRANCE WALK.5. SEE STRUCTURAL PLAN S12.01 FOR RADIANT HEATING DETAILS
- IN SIDEWALK AND COMPACTOR PAD. SEE MECHANICAL PLAN M02.02.00 FOR RADIANT PIPING LOCATIONS.
 6. CONTRACTOR SHALL PROVIDE A TEMPORARY WATER MAIN TO MAINTAIN THE LOOP SYSTEM REQUIRED BY PORTLAND WATER
- DISTRICT. THE TEMPORARY DESIGN FOR THIS WATER MAIN AND OTHER REQUIRED SERVICES SHALL BE REVIEWED AND APPROVED BY PORTLAND WATER DISTRICT AND THE CITY OF PORTLAND FIRE DEPARTMENT. 7. PEDESTRIAN SIDEWALKS RAMPS SHALL BE PROVIDED AT ALL
- STREET CORNERS, CROSSWALKS AND DRIVEWAYS.

HEATING PLANT:

THE JETPORT TERMINAL EXPANSION HEATING SYSTEM CONSISTS OF A HIGH TEMPERATURE (180 DEG F) HEATING WATER LOOP AND A LOW TEMPERATURE (130 DEG F) HEATING WATER LOOP.

WATER-TO-WATER HEAT PUMP WHP-1 SHALL PROVIDE 130 DEG F WATER FOR THE LOW TEMPERATURE HYDRONIC HEATING SYSTEM DURING THE HEATING SEASON. THE HEAT SOURCE FOR THE HEAT PUMP SHALL BE A GEOTHERMAL BOREFIELD ON THE JETPORT PROPERTY.

THE PLANT SHALL ALSO CONTAIN TWO NATURAL GAS/NO. 2 FUEL OIL FIRED HOT WATER BOILERS B-1 AND B-2. EACH BOILER SHALL BE EQUIPPED WITH A MODULATING BURNER INCLUDING A VFD ON THE BURNER MOTOR. THE DDC SYSTEM SHALL ENABLE THE BOILERS FOR OPERATION WHEN THE OUTDOOR AIR TEMPERATURE IS BELOW 50 DEG F. (ADJUSTABLE) THE BOILER BURNER SHALL MODULATE TO MAINTAIN THE BOILER WATER SUPPLY SET POINT WHICH WILL BE RESET BY THE DDC SYSTEM TO FOLLOW THE AMBIENT TEMPERATURE. AN ASSOCIATED BOILER CIRCULATING PUMP SHALL CYCLE TO PROVIDE HEAT TO THE HIGH TEMPERATURE HYDRONIC WATER LOOP TO MAINTAIN THE SYSTEM SUPPLY SETPOINT TEMPERATURE. WHEN ANY BOILER OR WATER HEATER CALLS FOR HEAT, SUPPLY FAN SF-2 SHALL START AND THE ASSOCIATED MOTOR OPERATED DAMPER SHALL OPEN. SF-2 SHALL RUN UNTIL THE CALL FOR HEAT IS SATISFIED. A SYSTEM OF EXHAUST FANS MOUNTED AT THE FLUE OUTLET SHALL MODULATE TO MAINTAIN A CONSTANT DRAFT PRESSURE SET POINT. THE BOILER PLANT SHALL PROVIDE HIGH TEMPERATURE WATER FOR THE HYDRONIC HEATING SYSTEM AND SHALL PROVIDE DOMESTIC HOT WATER DURING THE HEATING SEASON. DURING THE SUMMER MONTHS, THE BOILERS SHALL BE SHUT OFF.

THE BOILERS SHALL BE ARRANGED TO PROVIDE SUPPLEMENTAL HEATING TO THE LOW TEMPERATURE HYDRONIC LOOP AS REQUIRED. IN CASE OF A POWER OUTAGE, THE BOILERS SHALL RUN FROM THE EMERGENCY GENERATOR TO PROVIDE HEAT TO THE HIGH AND LOW TEMPERATURE HYDRONIC LOOPS FOR FREEZE PROTECTION.

DURING THE SUMMER MONTHS, THE BOILERS SHALL BE LOCKED OUT AND DOMESTIC HOT WATER SHALL BE SUPPLIED BY THE WATER-TO WATER HEAT PUMP SUPPLEMENTED BY A PAIR OF NATURAL GAS/NO. 2 FUEL OIL FIRED DOMESTIC WATER HEATERS. A SYSTEM OF EXHAUST FANS MOUNTED AT THE FLUE OUTLET SHALL MODULATE TO MAINTAIN A CONSTANT DRAFT PRESSURE SET POINT. A DOMESTIC HOT WATER RECIRCULATION PUMP SHALL RUN CONTINUOUSLY TO MAINTAIN HOT WATER FLOW TO REMOTE FIXTURES. (NOTE: SEE PLUMBING DRAWING P00.30 WATER HEATER SCHEDULE FOR EQUIPMENT EXCEPT WATER HEATERS SHALL BE GAS-FIRED ONLY AND SUPERSTOR STORAGE TANKS SHALL BE FURNISHED WITH DUAL COILS. IN EACH STORAGE TANK, ONE COIL SHALL BE PIPED TO THE WATER-TO-WATER HEAT PUMP AND THE OTHER COIL SHALL BE PIPED TO A GAS-FIRED WATER HEATER.)

HYDRONIC SYSTEM SUPPLY PUMPS:

DOMESTIC WATER HEATING:

THE DDC SYSTEM SHALL ENABLE THE HIGH TEMPERATURE AND LOW TEMPERATURE HYDRONIC SYSTEM SUPPLY PUMPS FOR OPERATION WHEN THE OUTDOOR AIR TEMPERATURE IS BELOW 50 DEG F. (ADJUSTABLE) THE HYDRONIC SYSTEMS SUPPLY PUMPS SHALL BE ARRANGED IN A LEAD/LAG SEQUENCE. IF A LEAD HYDRONIC SYSTEM SUPPLY PUMP FAILS TO START, THE LAG PUMP WILL BE STARTED AND THE DDC SYSTEM SHALL SEND AN ALARM TO THE DESIGNATED MAINTENANCE REPRESENTATIVE. THE LEAD AND LAG PUMPS SHALL BE SWITCHED OVER ON A WEEKLY BASIS. THE PUMPS SHALL BE FURNISHED WITH VFDS AND THE PUMP RPM SHALL BE MODULATED TO ADD HIGH TEMPERATURE WATER MAINTAIN A LOW TEMPERATURE LOOP SUPPLY TEMPERATURE OF 130DEG F. HYDRONIC SYSTEM DDC CONNECTION:

THE DDC SYSTEM SHALL MONITOR THE HYDRONIC SYSTEMS SUPPLY TEMPERATURE, RETURN TEMPERATURE, SUPPLY PRESSURE OFF THE PUMPS; RETURN PRESSURE JUST BEFORE THE PUMPS; AND GPM FLOW TO THE BOREFIELD. HIGH TEMPERATURE LOOP

THE HIGH TEMPERATURE HYDRONIC LOOP SHALL SUPPLY HEAT TO THE FINNED RADIATION ALONG THE EXTERIOR WALLS, UNIT HEATERS IN STAIRWELLS AND BAGGAGE HANDLING SPACES, FAN COIL UNITS AND A SMALL NUMBER OF RADIANT FLOOR MANIFOLDS. THE HYDRONIC LOOP SUPPLY TEMPERATURE SHALL BE RESET FROM THE OUTDOOR AIR TEMPERATURE IN ACCORDANCE WITH THE

FOLLOWING SCHEDULE:

LOW TEMPERATURE LOOP

OUTDOOR AIR TEMPERATURE HIGH TEMPERATURE HYDRONIC WATER SUPPLY TEMPERATURE

50 DEG F (ADJUSTABLE) 140 DEG F (ADJUSTABLE) 0 DEG F (ADJUSTABLE)

180 DEG F (ADJUSTABLE)

THE LOW TEMPERATURE HYDRONIC LOOP SHALL SUPPLY HEAT TO AIR HANDLING UNIT 1 AND 2 HEATING COILS, VAV BOX HEATING COILS, MOST SNOW MELT AND RADIANT FLOOR MANIFOLDS AND ONE UNIT HEATER. THE WATER SUPPLY TEMPERATURE SHALL BE 130 DEG F SUPPLIED BY WATER-TO-WATER HEAT PUMP WHP-1. THE DDC SYSTEM SHALL CONTROL THE LOW TEMPERATURE HYDRONIC SUPPLY PUMP TO MAINTAIN A 20 DEG F TEMPERATURE DIFFERENTIAL. (ADJUSTABLE) THE WATER-TO-WATER HEAT PUMP HEAT SOURCE SHALL BE THE GEOTHERMAL BOREFIELD AND THE SOURCE WATER SHALL BE CIRCULATED TO AND FROM THE BOREFIELD BY BOREFIELD/FLUID COOLER PUMP P-3 WITH PUMP P-4 AS BACKUP. THE HEAT SOURCE SHALL BE CONTROLLED AS FOLLOWS: PUMP P-3 SHALL RUN CONTINUOUSLY. ON A CALL FOR HEAT BY THE LOW TEMPERATURE HEATING LOOP, WHP-1 SHALL RUN TO PRODUCE 130 DEG F WATER AND SHALL REJECT COOLED WATER TO THE BOREFIELD. PUMP P-3 SHALL MODULATE ITS SPEED TO MAINTAIN THE BOREFIELD SUPPLY WATER TEMPERATURE BETWEEN 80 DEG F AND 39.5 DEG F. IF THE BOREFIELD SUPPLY TEMPERATURE DROPS TO 39.5 DEG F, THE GAS-FIRED BOILERS AND ASSOCIATED CONTROL VALVE SHALL MODULATE TO INJECT HIGH TEMPERATURE LOOP WATER TO MAINTAIN A WATER SUPPLY TEMPERATURE OF 130 DEG F IN THE LOW TEMPERATURE HEATING LOOP SUPPLY MAIN.

COOLING PLANT:

THE COOLING PLANT SHALL CONSIST OF WATER-TO-WATER HEAT PUMP WHP-1, CENTRIFUGAL CHILLER C-1, A GEOTHERMAL BOREFIELD OF DRILLED WELLS, FLUID COOLER <u>EFC-1</u> ON THE MECHANICAL ROOM ROOF, AND CHILLED WATER AND FLUID COOLER/GEOTHERMAL BOREFIELD CIRCULATING PUMPS.

THE COOLING PLANT SHALL BE ENABELED AS FOLLOWS: THE WATER-TO-WATER HEAT PUMP SHALL BE ENABLED AT ALL TIMES. THE CENTRIFUGAL CHILLER SHALL BE ENABLED WHEN THE OUTDOOR TEMPERATURE IS ABOVE 55 DEG F. (ADJUSTABLE) BOTH THE WATER TO WATER HEAT PUMP AND THE CENTRIFUGAL CHILLER SHALL BE UNDER LOCAL CONTROL AUTHORITY; BUT BOTH SHALL BE CAPABLE OF REPORTING AND DOCUMENTING OPERATING PARAMETERS TO THE OWNERS DDC SYSTEM, INCLUDING PRODUCTION OF DAILY REPORTS AND STORAGE OF 12 MONTHS WORTH OF OPERATING DATA AS DESCRIBED IN THE SPECIFICATIONS.

BOTH THE WATER-TO-WATER HEAT PUMP AND THE CENTRIFUGAL CHILLER SHALL TAKE HEAT FROM THE BUILDING AND REJECT IT TO THE BOREFIELD AND/OR THE FLUID COOLER. THE HEAT REJECTION CONTROL SHALL BE AS FOLLOWS: AS THE COOLING LOAD (AND ASSOCIATED CONDENSER LOAD) INCREASES, THE GEOTHERMAL BOREFIELD WELL SYSTEM PUMP SPEED SHALL INCREASE UP TO UP TO 435 GPM DIRECTED TO THE BOREFIELD. AS THE BOREFIELD RETURN WATER TEMPERATURE INCREASES ABOVE 80 DEG F, THE FC/GBF CONTROL VALVES WILL OPEN TO THE FLUID COOLER AND THROTTLE TO THE BOREFIELD AND THE PUMP SPEED WILL INCREASE TO SUPPLY BOTH THE BOREFIELD AND THE FLUID COOLER. AT MAXIMUM COOLING LOAD, THE BOREFIELD RETURN WATER TEMPERATURE SHALL BE NO HIGHER THAN 80 DEG F. WHEN THE OUTDOOR AIR TEMPERATURE IS BELOW 40 DEG F (ADJUSTABLE), THE FLUID COOLER BASIN PUMP SHALL BE SHUT OFF AND THE BASIN SHALL BE DRAINED.
